COMBINED RETINA SURGERY + CATARACT / IOL / CORNEA /GLAUCOMA

OPTIMIZING INTERSCELERAL FIXATION IN POSTERIOR SEGMENT SURGERY

Oral Presentation

During vitreoretina surgery In aphakia and absence of posterior capsule as in case of trauma , the IOL implantation is challenging and add difficulties to the surgery as it will associated with tilting of IOL during A/F exchange or even silicone oil migration during and after surgery

We did 4 point fixation using Amon needle forceps and 4 closed loop IOL like iso pure lens by insertion of IOL above the iris diaphragm and passing 6/0 praline through the closed loops making a loop around and exits to the sclera then flanging the exit suture

The stability of IOL being 4 points fixation is good and The overall diameter of IOLwas enough to make a suitable barrier between anterior and posterior segments and thus prevent migration of air and or silicone to AC during and after surgery

The stability of IOL being 4 points fixation is good and The overall diameter of IOLwas enough to make a suitable barrier between anterior and posterior segments and thus prevent migration of air and or silicone to AC during and after surgery
