A Vitreoretinal Surgeon shouldn't hope for a perfectly smooth day every time. Unexpected mishaps, a series of hiccups, and obstacles can arise, even in cases that appear straightforward, which may prolong the surgical procedure and sometimes make the prognosis unpredictable.

This video-based instructional course will cover these kinds of unanticipated hurdles when dealing with cases of cannula related complications, complications during PVD induction, unexpected intraoperative Vitreous Haemorrhage in a planned combined surgery with pre-operative clear media, intraoperative sudden kissing choroidal detachment, intraoperative foveal blow-out during sub-retinal rt-PA injection, choroidal bleed, PFCL-related complications, refractory macular holes, dealing humongous retained intraocular foreign bodies among others.

Attendees will benefit from learning about the turning points that may complicate a simple case, thereby helping them anticipate and understand potential solutions and the best management strategies.

Intraoperative complications are often inevitable, but timely proper management can save the vision.
